Davide,

I think we're ready to make the final push on closing the CES AAR recommendations. All we have left is the imaging and transference of services of the two Dell PowerEdge R630s (both in CES private network data center) and the replacement of the UPSs. Per our conversations, one server is for DC/NAS and the other for Epic. I checked with Steven Dean and both servers not running any services so we can begin as soon as possible without impacting their services. The UPSs were ordered last week and we are waiting on delivery. I've included the project milestones and suggested due dates. If these due dates are not feasible, please provide alternative dates. If you have any questions, please feel free to reach out.

Regards,

Chris

Davide,

I am reseedling this email because for some reason, it was sent to a dgaetano@students.kennesaw.edu account.

Per your instructions regarding the reimaging and installation of the CES server, we DBAN'd the hard drives and delivered the server to TS023. The server is a Dell PowerEdge R610 (Asset Tag: 103019). When it is ready for racking in the CES private network, please let me know and I'll coordinate with the Steven Dean.

Regards,

Chris
